My name is Joseph (Joe) Darnell owner of Flutter Busters. This is my story.

On December 4, 2014, my daughter Kyanna was diagnosed with DIPG (Diffuse Intrinsic Pontine Glioma), which is brain cancer. We were given 2 options. One was to go home and enjoy what time we had left and the other was to go through radiation, with the idea that it would buy us more time. The doctors told us that even if the radiation went well, the tumor would come back and there would be nothing they could do at that point. Our daughter was terminally ill. The questions of why this happened no one could answer. We chose an alternate path. On December 13th, we left the country. Our goal was to find out how this happened and fix it—not to wait and watch our daughter die. If we were to go down, it would be swinging. Our family left the country and flew to Spain for treatment. Through blood tests, one of Kyanna's issues was identified as a sensitivity to electromagnetic fields (EMFs), and there were also many other issues. We started on a path to fix them all. We bought medical equipment, we learned, and we did everything we could do, starting off with Kyanna's treatments in Spain for 3 weeks.

We came back to the US December 31st. We continued treatments and got everything in place for a battle with cancer. With alternative treatments one of the most important things you need is time, but time is what we didn't have. Kyanna passed away in my arms February 3rd, 2015.In August of 2015, my father was diagnosed with stage 4 kidney cancer. With no real recourse, our family tried the same things again. Through blood work, my father too showed a sensitivity to EMFs, which prompted me to begin researching EMFs more. As I read research and learned of the many adverse effects that can result from overexposure to EMFs, I identified a potential starting point for what went wrong with Kyanna. All of the issues had a link to EMF exposure. There wasn't just one frequency—there were many kinds. It was at this point that I started buying equipment and measuring EMFs. I found numerous things that I had missed previously, and many things Kyanna had been exposed to for long periods of time could have led to her cancer. EMFs are everywhere—you cannot escape them. You can learn to identify them, then take steps to try to minimize or block exposure.

There wasn't just one frequency—there were many kinds. It was at this point that I started buying equipment and measuring EMFs. I found numerous things that I had missed previously, and many things Kyanna had been exposed to for long periods of time could have led to her cancer. EMFs are everywhere—you cannot escape them. You can learn to identify them, then take steps to try to minimize or block exposure. EMFs will affect people differently. As a general rule, changes in skin, nervous system, and/or blood will occur first because that is what comes into contact with EMFs first. EMFs can be linked to cancers of the blood or nervous system, anything that deals with the central nervous system (behavior issues in kids, depression, anxiety), auto immune issues, blood issues (diabetes) and many other health concerns. EMFs are everywhere, and the fields that you are exposed to are getting bigger and there are more of them every day. This can lead to more adverse health effects as a result. When Kyanna was sick we tried to share as much as we could, as many people wanted to know what we found out. They too wanted to know why. This prompted me to begin Flutter Busters, to help people identify and avoid EMFs that are now inundated in our lives. I offer home testing both locally and remotely so we can find out which problems are biggest in your lives and identify ways to deal with them.

It is not if you have problem, it is a matter of how big a problem you have, and then learning ways to deal with it. Through Flutter Busters, I also provide education on EMFs, as many are unaware they even exist, not to mention the health risks associated with them.My company is named Flutter Busters because when Kyanna was in the hospital she named her brain tumor Flutter. Everything that we did to kill Flutter was known as a Flutter Buster. It is because of her that I do this. My goal is to help people avoid what happened to us. It starts by doing a lot of little things differently, before you have a resulting health problem.

Flutter Buster services include: 1. Consults (over the phone or video calls) home inspections. Home inspections normally take 2-3 hours and the inspection should only need to be completed once, unless something changes significantly in your home environment. I charge by the hour ($120 / hr or $30/ 15 minutes). For people that live far away I offer remote testing, by sending equipment to them so they can test and then we go over the results. The cost for that is $575, which includes shipping, the consultation time, and the equipment rental.
